

<b>Program and Degree: BSc in Aerospace Engineering</b>	
<b>Course Description</b>	
<b>Course Title</b>	<b>Mechanical Vibrations</b>
<b>Prerequisites</b>	Dynamics, Engineering Mathematics
<b>The course aims</b>	<p>Students' acquaintance with the principles, concepts and applications of vibrations in engineering</p> <ol style="list-style-type: none"><li>1- Ability to mathematical modeling of vibrations of simple and complex systems</li><li>2- The ability of solving vibrations problems by analytical and numerical methods</li><li>3- Damping of the vibrations and the isolation of the devices from the effects of vibrations</li></ol>
<b>Contents</b>	<ol style="list-style-type: none"><li>1- Definition and concepts of oscillatory motions, harmonic periodic motions, degrees of freedom, mathematical model of dynamical systems, linear and nonlinear systems</li><li>2- Free Vibrations of systems: Motion equations using Newton's laws, the principle of Dulmer's method and energy method, vibrations without depreciation and amortization, logarithmic degradation, effective and equivalent mass</li><li>3- Force vibrations of systems: types of external efforts, Analysis of vibrations with complex numbers and time and frequency methods, general motion of the system and the principle of supper position</li><li>4- Application of vibrations: springs and dampers, viscos and dry friction, vibration reduction and vibration isolation, vibration measurement instruments, vibration with non-harmonic stimulation, Laplace transform, numerical solution of vibrations</li><li>5- Vibration of systems of two degrees of freedom, dynamic absorption of vibrations, impact phenomena and related systems</li><li>6- critical speed of rotary shafts</li><li>7- Vibrations of several degrees of freedom and continuous systems such as beams, cables, and vibration.</li></ol>
<b>Duration</b>	<b>1 Semester (16 weeks)</b>
<b>Course Hours</b>	<b>3 hours/week</b>
<b>Course Type</b>	<b>Required</b>
